1. Safety

Key to symbols

The following symbols are used in the JDC Line 1000 lighting fixture's user documentation:

Warning! Safety hazard.
Risk of severe injury or death.

Warning! Hazardous voltage.
Risk of lethal or severe electric shock.

Warning! See user manual for important safety information.

Warning! Fire hazard.

Warning! Risk of eye injury.

Warning! Read the **JDC Line 1000 Quick Start and Safety Manual** supplied with the fixture and available for download from www.glp.de before installing, operating or servicing the fixture. The Quick Start and Safety Manual contains important information for the safe use of JDC Line 1000 fixtures. If you fail to read that information you may create a safety hazard with a risk of injury, death or damage.

If you have any doubts or questions about how to use the GLP® JDC Line 1000 lighting fixture safely, contact your GLP supplier for assistance. Your GLP supplier will be happy to help.

The user documentation for JDC Line 1000 fixtures consists of three documents:

- The **JDC Line 1000 Quick Start and Safety Manual**, supplied with JDC Line 1000 fixtures and available for download from www.glp.de. The Quick Start and Safety Manual contains important safety information and installation instructions that the installer and user must read. It also contains dimensions drawings and technical specifications for the fixture.
- The **JDC Line 1000 User Manual**, available for download from www.glp.de. The User Manual explains features and control of JDC Line 1000 fixtures.
- The **JDC Line 1000 DMX Channel Index**, available for download from www.glp.de. The Channel Index is a separate document containing the DMX control channel layout and DMX commands available in the fixture. This information is also included in the User Manual.

The JDC Line 1000 is intended for use by experienced professionals with the knowledge and skills to set up, operate, and maintain high-powered, remotely controlled lighting

equipment safely and efficiently. These operations require expertise that may not be provided in this manual.

- Respect all warnings and directions given in the fixture's user documentation and on the fixture. Read the fixture's Quick Start and Safety Manual and familiarize yourself with the safety precautions it contains before installing, using or servicing the fixture. GLP and affiliated companies will take no responsibility for damage or injury resulting from disregard for the information in the user documentation.
- Check the GLP website at www.glp.de and make sure that you have the latest versions of the fixture's Quick Start and Safety Manual and this user manual.
- Check the fixture software version indicated on page 2 of this user manual and then use the fixture's control panel to check the version installed in the fixture. If the versions are not the same, the user manual may still cover the fixture, because software updates do not always affect the use of the fixture. However, it is possible that this manual does not match the fixture perfectly. Software release notes can help clarify this question. You can consult software release notes and download the correct version of this user manual on the GLP website if necessary.
- Make both the Quick Start and Safety Manual and this user manual available to all persons who will install, operate or service the fixture. Save both documents for future reference.
- If you have any questions about the safe operation of the fixture, please contact an authorized GLP distributor (see list of distributors at www.glp.de).

GLP Service and Support

Contact information for the nearest GLP Service and Support is available online at www.glp.de/en/service, by email at info@glp.de, or by telephone at the following numbers:

- GLP Germany: +49 (7248) 927 19-55
- GLP N. America: +1 818 767-8899
- GLP UK: +44 1392 690140
- GLP Asia: +852 (3151) 7730
- GLP Nordic: +46 737 57 11 40

3. Features

The JDC Line 1000 from GLP® is a powerful LED-based strobe/color effect linear lighting fixture. It combines a powerful strobe line with RGB and white pixel mapping in one device.

The JDC Line 1000 is twice the length and has twice the performance of GLP's JDC Line 500. The JDC Line 1000 has the advantage that it only requires one power connection, one data connection and one control panel to run 1000 mm of JDC Line pixels. Internally, the JDC Line 1000 has two separate strobe and effect engines, which lets you operate it as if it was two separate 500 mm fixtures.

The DMX channel layout of the JDC Line 1000 is based on the layout of 2 x JDC Line 500s. This means that you can simply patch two JDC Line 500s next to each other to control one JDC Line 1000. The *Control / Settings* channel of the second patched fixture is ignored – the JDC Line 1000 uses the *Control / Settings* channel of the first patched fixture only.

It features:

- Two sections, **A** and **B**, that can be controlled as if they were two JDC Line 500 fixtures.
- Easy integration with the JDC Line 500: one JDC Line 1000 fixture maps onto two JDC Line 500 fixtures in an existing DMX control setup.
- 2 x 20 super-bright White 25 mm strobe segments
- 2 x 40 super-bright 25 mm RGB segments
- RGB segments can be split into two (80 segments total) for even more zig-zag effects
- White, RGBW and RGB strobes
- White and RGB pixel mapping, White strobe over RGB pixel mapping, and RGB strobe over White pixel mapping
- RGBW background channels with separate dimmer for continuous ambient light
- Powerful FX engines with a range of pre-programmed pixel patterns
- Interlocking design that allows almost gapless installation of multiple fixtures
- Rear airflow design that lets you stack fixtures on top of each other or place them directly on the ground
- Ease of installation with smart, flexible rigging and mounting options
- Control panel with new backlit multicolor LED display
- Quarter-turn locking points for omega clamps and end-to-end fastener bars

The JDC Line 1000 features a central tube of 200 x powerful White LEDs in 40 segments across its Sections A and B. The white LEDs provide impressive strobe effects and pixel mapping. Above and below the White LEDs are 400 x RGB LEDs in two rows that can be controlled as 20, 40, 60 or 80 segments. The RGB LEDs also provide strobe effects and pixel mapping.

A range of pre-programmed dynamic FX patterns with variable parameters can be selected and run on the White and RGB segments.

The JDC Line 1000 can be used indoors in permanent and temporary installations. It can be placed horizontally on a level surface, suspended from a suitable rigging structure or mounted on a structure or surface as described in the fixture's Quick Start and Installation Manual.

Fixtures can be interlocked in lines, and power and data can be daisy-chained for ease of installation.

A magnetic system lets you mount optical accessories from GLP on the front of the fixture in seconds. Six M4 threaded holes on Section A and six on Section B are provided for more permanent installation of optical accessories.

The JDC Line 1000 is not suitable for household use, for use in any location where unattended children have access to it, or for use in permanent outdoor installations.

Fixture setup

The JDC Line 1000 has an onboard control panel with a graphic display (see 'Control menus and onboard display' on page 16) that you can use to configure the fixture's settings. You can also access all the fixture's important settings remotely via DMX on the fixture's *Control / Settings* channel (DMX channel 6 in all DMX modes).

Sections A and B

The JDC Line 1000 can be controlled as if it was two separate JDC Line 500 fixtures that make up two halves of the JDC Line 1000. The two halves are controlled as **Section A** and **Section B**.

You can swap the positions of Section A and Section B in the Fixture Settings menu in the fixture's control panel, on the Control / Settings DMX channel, or via RDM.

Strobe effects

The JDC Line 1000 features RGBW strobe effects that you can run on all the fixture's LEDs together over a background with RGBW control. It also offers RGB and White strobe effects that you can run separately. Again, you can run White and RGB strobe effects over a background with RGBW control.

All strobe effects feature a powerful effects engine with pre-programmed patterns. You can snap between patterns and between steps in patterns, or you can crossfade with variable fade times.

Individual Cell Control

Some of the control modes provide individual control of the white or RGB segments.

On the JDC Line 1000 the line of powerful White LEDs can be split into 40 segments: 20 segments in Strobe A and 20 segments in Strobe B. The line of powerful RGB LEDs can also be split into 40 segments with the additional possibility of separating the top and bottom half of each segment to give individual control of 80 RGB pixels. The segments can be controlled like 2 x JDC Line 500s.

For normal pixel-mapping applications (MultiPix Mode) the upper and lower half of each RGB Segment are controlled at the same time. Advanced pixel-mapping mode (MultiPix Advanced Mode) allows individual control of the top and bottom part of the pixel.

RGB Pattern selection offers both segment patterns and split-segment patterns.

Shutter / intensity effects

The JDC Line 1000's electronic shutter effect provides single flash, pulse, opening pulse, closing pulse, random pulse, random opening pulse, random closing pulse, double flash, random double flash, triple flash, random triple flash, spike, lightning, random pixel flash and random fixture flash effects as well as instant blackout.

Background Color

All control modes offer a set of RGBW channels with a separate dimmer called Background Color. By default, these channels should be set to 0% because they are not necessary for normal use of the fixture.

The Background Color channels let you add a low-priority background color, giving you the ability to set a continuous background color for ambient light in the set design, for example. You can add any of the fixture's other effects on top of the background color at any time.

Background Color works as in these two examples:

- No Background Color active - Background Color is set to 0%.

You can use the main fixture as normal, but all flash effects run on top of a "black" background. The intervals between flashes are black (off).

- Background Color active - Background Color is set to Blue 100%.

You can use the main fixture as normal, for example red flashes, but all flash effects run on top of a blue background. This gives red flashes with blue in-between the flashes.

Background color and main color mixing

You can define how the background color and the main fixture color are mixed. There are three options:

1. **Crossfade** (default) – the Background Color stays in the background and the main color has higher priority. If you fade in a main color, the background color will crossfade to the main color. For example, if you set a blue background color and then fade in continuous red on the main color channels you will obtain a crossfade from blue background to red main color.
2. **Mix** – the Background Color mixes with the main color. For example, if you set a blue background color and then run a red Flash on the main color channels, the result will be a magenta flash. The main color of the flash will mix with the background color.
3. **Override** – the Background Color stays in the background. The color displayed using the main channels has higher priority and will not mix with the background color. As soon the main color value is >0 the background color will black out and the main color will appear. For example, if you set a blue background color and then fade in continuous red on the main color channels, the blue will disappear completely and the red will fade up from zero intensity. The main red color will not mix or crossfade with the background blue color.

You can select the Crossfade, Mix or Override options in the **Fixture Settings** menu in the fixture's control panel, on the *Control / Settings* DMX channel, or via RDM.

Dimming

The Dimmer channels control the output of the fixture in 16-bit resolution. You can select from Linear or Soft dimming curves in the **Fixture Settings** menu in the fixture's control panel, on the *Control / Settings* DMX channel, or via RDM.

See Figure 2. The dimming curve options available are:

- **Linear** - the Linear setting gives a dimming curve that the eye perceives as linear. Intensity appears to increase and decrease evenly throughout the dimming range.
- **Soft** - The Soft (square law) setting gives finer control at lower light levels, where the eye is most sensitive to changes in light intensity, and coarser control at higher light levels. This is the default dimming curve setting.

Figure 2. Dimming curves

Duration

The Flash Duration channel lets you adjust the length of flashes from super-short to long.

You can change the Duration style setting in the Fixture Settings menu in the fixture's control panel, on the *Control / Settings* DMX channel, or via RDM. Two different types of flash duration control are available:

- **Normal** control lets you vary the duration from short to long independently of the Flash Rate channel setting. This is the default flash duration setting.
- **Percentage** control lets you vary the duration as a percentage of the selected Flash Rate.

Rate

If no intensity effect is selected, the Flash Rate channel lets you adjust the interval between flashes:

- At DMX values from 000 to 004 the fixture will not flash.
- At DMX values from 251 to 255 the fixture will execute a continuous on.
- At DMX values from 005 to 250 the fixture will perform flashes with long intervals to super-short intervals between flashes.

If an intensity effect is selected, the Flash Rate channel lets you adjust the speed of the intensity effect.

Flash style

The JDC Line 1000 offers two types of LED behavior when operating as a strobe:

- **Normal** sets LEDs to light continuously during flashes at the PWM rate set using the control panel (the default rate is 3000 Hz). This is the default flash style setting.
- **Xenon** sets LEDs to mimic the high-frequency flicker during flashes that is characteristic of xenon tube strobe lights.

You can change the Flash style setting in the **Fixture Settings** menu in the fixture's control panel, on the *Control / Settings* DMX channel, or via RDM.

White point

This setting lets you select the white point obtained when RGB is set to 100% and obtain a clean white light with fixed white point when opening the fixture's shutter without adjusting RGB color or programming color presets. The following color temperatures are available as fixed white points: **8000 K**, **6500 K** and **5600 K**. The default setting is **6500 K**.

Setting White point to **Off** disables this feature and puts RGB control into raw mode.

You can change the White point setting in the **Fixture Settings** menu in the fixture's control panel, on the *Control / Settings* DMX channel, or via RDM.

CTC

Using the CTC (Color Temperature Correction) channel lets you temporarily leave the fixed white point of the fixture and change it within a color temperature range of 10 000 K to 2 500 K.

Note that RGB needs to be set to 100% to mix pure white. Decreasing RGB values will modify the color relative to the chosen CTC white point.

Pixel mirror

To achieve symmetrical effects in multiple installations or co-ordinate effects when fixtures are not oriented identically, the JDC Line 1000 lets you quickly reverse and/or invert the order of the pixels in each section, A and B:

- **Off** gives normal pixel layout (see Figure 3). Pixel 01 is at the Power OUT/THRU end of the fixture, on the left when facing the fixture with the fixture oriented normally. This is the default pixel layout setting.

RGB Upper	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20
White	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20
RGB Lower	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40

Figure 3. Normal pixel layout in Section A (identical in Section B)

- **X-mirror** reverses the order of the pixels so that they run from right to left. In this configuration, Pixel 01 is at the Power IN end of the fixture, on the right when facing the fixture with the fixture oriented normally.
- **Y-mirror** inverts the RGB pixel rows so that the pixels run from left to right but pixels 11 to 20 move to the top row and pixels 1 to 10 move to the bottom row of the fixture. *Top and bottom are relative to the control panel display when the display orientation is set to Normal.*
- **X-Y-mirror** reverses the order of the pixels and inverts the RGB pixel rows at the same time.

You can change the Pixel mirror setting on the *Control / Settings* DMX channel, in the **Fixture Settings** menu in the fixture's control panel.

No-signal behavior

You can decide how the fixture should behave if it is not receiving a DMX signal (if the fixture is being controlled by DMX but the DMX signal stops, or if you apply power to the fixture when no DMX signal is present). Three options are available:

- **Blackout** – The fixture goes to dead blackout. This is the default setting.
- **Hold** – The fixture holds the last DMX values that it received.
- **Houselight** – The fixture switches to the maximum light level that can be displayed continuously.

These settings are available on the *Control / Settings* DMX channel, in the **Fixture Settings** menu in the fixture's control panel, or via RDM.

To avoid any possibility of unexpected behavior from a powerful strobe light if the DMX signal fails, we recommend that you always set the fixture to **Blackout** or **Houselight**.

Fan Mode

The Fan Mode setting gives different options for the fixture's cooling fan operation and temperature management. Having options to choose from can be very helpful if you are operating the fixture in a very hot or noise-sensitive environment. Four options are available:

- **Regulated** – gives priority to light output and only operates fans as necessary. If the fixture is blacked out, fans run at minimum speed. When light output intensity is increased, temperature regulation increases fan speed to the level necessary to keep the fixture at optimum temperature.

If light output is set to maximum intensity but the fans can keep the fixture at optimum temperature, there will be no regulation of light intensity. If the fixture begins to exceed optimum temperature and fans are running at maximum speed it will begin to limit light intensity until optimum temperature can be maintained.

Regulated is the default fan mode setting.

- **High** – lets the fixture operate at maximum light output and suits operation in high ambient temperatures. Fans are set to constant operation at high speed. Light output intensity is limited smoothly if it becomes necessary in order to keep fixture temperature at optimum temperature level.

Besides maximizing light output in high ambient temperatures, you can use the **High** mode to cool down a fixture quickly or to remove dust from cooling fans.

- **Medium** – sets fans to constant operation at medium speed. Light output intensity is reduced to a level where it will normally remain constant at ambient temperatures of up to 45° C (113° F). Intensity is smoothly limited further if it becomes necessary in order to keep fixture temperature at optimum temperature level.
- **Low** – sets fans to constant operation at low speed and is optimized for minimum noise. Light output intensity is reduced to a level where it will normally remain constant at ambient temperatures of up to 30° C (86° F). Intensity is smoothly limited further if it becomes necessary in order to keep fixture temperature at optimum temperature level.

In all fan modes, if fixture temperature reaches a dangerous level, LEDs will be shut down for a period until the fans have brought the temperature down to a safe level.

PWM frequency

You can change the LED dimming PWM frequency in order to avoid flicker and beat frequencies in video images. To do this, select a new PWM frequency using either the *Control / Settings* DMX channel, the **Fixture Settings** menu in the fixture's control panel or RDM.

The default PWM setting is 3000 Hz. You can set the PWM frequency to 2200 Hz, 3000 Hz, 4800 Hz or 9600 Hz. Note that a higher PWM frequency may affect dimming performance.

The PWM frequency setting is stored in the fixture and is not affected by cycling power off and on. However, it will be reset to the default frequency if you apply a **Fixture Settings → Load Settings → Default** command or a **Service → Advanced → Load Factory Backup** command in the control menus.

As a rule, you should set all the fixtures in an installation to the same PWM frequency in order to ensure the same performance.

Display mode

You can choose between three different modes for the control panel display:

- **Auto**: The display will automatically switch off after a few seconds if the fixture is receiving a valid control signal and has not detected an error. If the fixture is not receiving a valid control signal the display will flash. If the fixture has detected an error, the display will remain constantly on and show the error. This is the default setting.
- **On**: The display stays on constantly. This setting can be useful when you are configuring or servicing the fixture.
- **Off**: The display will automatically switch off after a few seconds even if the fixture is not receiving a valid control signal or if it has detected an error.

You can change the Display mode setting on the *Control / Settings* DMX channel, in the **Fixture Settings** menu in the fixture's control panel, or via RDM.

Display orientation

Depending on which way up you install the fixture, you can change the orientation of the control panel display:

- **Auto:** The readout in the display is automatically turned through 180° if the fixture is installed upside-down. This is the default setting.
- **Normal:** The readout in the display is the right way up when the fixture is placed with the display closer to the right-hand end of the fixture, close to the Mains Power OUT/THRU connector, as shown in Figure 1 on page 6.
- **Inverted:** The readout in the display is turned through 180°.

You can change the Display orientation setting on the *Control / Settings* DMX channel, in the **Fixture Settings** menu in the fixture's control panel, or via RDM.

Custom settings presets

The JDC Line 1000 sets you set up three different fixture configurations and save them as custom presets. A configuration includes all of the fixture's personality settings (dimming curve, pixel orientation etc.) but does not include DMX address, DMX mode and control protocol type.

Calling up a preset let you quickly recall configurations that you have set up in advance to match different uses or different environments.

You can save custom presets and load custom presets via DMX on the *Control / Settings* DMX channel. You can also save custom presets in the **Service → Advanced → Save Settings** menu and load custom presets in the **Fixture Settings** menu in the fixture's control panel.

Fixture information

The **Information** menu in the control panel gives access to items of information from the fixture's sensors and memory. You can check temperature sensor readouts, see total operating hours counters and power cycle count, and see DMX signal quality data, for example.

Manual control

If the JDC Line 1000 is connected to mains power, you can control it without using a DMX controller if you open the **Manual Control** menu in the control panel.

This menu also lets you reboot the fixture.

If the fixture is connected to a DMX controller, it is also possible to take a snapshot of all the DMX values that the fixture is receiving using a **Capture DMX Values** command. These values are then applied as manual control values and stored in memory. Each time that you enter the **Manual DMX** menu, the fixture will use these values until you adjust them or apply a **Reset Manual Values** command.

Custom settings and reloading factory defaults

Custom settings are stored after a power off/on cycle and after a reset.

Two options are available in the fixture's control panel for deleting multiple custom settings and restoring defaults:

- **Fixture Settings → Load Settings → Default** reloads all the fixture's factory default settings **except** DMX address, DMX mode and Control protocol. This option returns the fixture to baseline settings (Normal pixel orientation, Linear dimming curve, etc.) without affecting its basic configuration in an installation.
- **Service → Advanced → Load Factory Backup** reloads all the fixture's factory default settings **including** DMX address, DMX mode and Control Protocol. This option reinitializes the fixture completely and returns to its state when it left the factory.

Service

The **Service** menu is split into two levels: **Service** and **Service Advanced**.

The **Service Advanced** level is for trained technicians only. Read the User Manual carefully before entering this level.

Test Sequences

This menu lets you run different test sequences in order to quickly check the product for correct operation.

Reset Counters

The commands in this menu let you reset the fixture's user resettable counters.

Note that device counters are not reset if you execute a Load Factory Backup command.

4. Control menus and onboard display

Warning! DMX control is disabled when the control menus are active. Be prepared for the fixture to emit strong light as soon as you exit the control menus.

The control panel and onboard backlit LED display provide access to user settings, readouts and utilities.

Figure 5. Default screen

Figure 4. Main menu

The functions of the control buttons depend on which screen is open in the control panel display. The functions are indicated by icons:

BOTTOM-LEFT BUTTON (MENU / ENTER)

When the display is in sleep mode, the bottom-left MENU / ENTER button activates the display and calls up the default screen (see Figure 5) that gives the following information:

- Firmware version // DMX Mode
- Protocol type (DMX, Art-Net, sACN)
- DMX address
- DMX channel footprint.

When the default screen is active, the MENU / ENTER button  opens the main menu (see Figure 4).

When navigating in the menus, the MENU / ENTER button  confirms a selection, enters a sub-menu or implements a command.

TOP-LEFT BUTTON (QUICK MENU / BACK)

When the default screen is active, the QUICK MENU / BACK button  opens the quick menu.

When navigating in the menus, the QUICK MENU / BACK button  navigates back one level towards the top of the menu.

TOP-RIGHT BUTTON (UP)

Scroll up through a menu or increase a number.

BOTTOM-RIGHT BUTTON (DOWN)

Scroll down through a menu or decrease a number.

When you apply power to the fixture it takes a few seconds to boot. After it has booted, the panel displays the default screen.

DMX control is disabled when the control menus are active.

A number of options for customizing the onboard display are available on the *DMX Control / Settings* channel and in the *Display* control menu in the control panel.

Quick menu

A quick menu is provided to save time. To open the quick menu, activate the default screen by pressing the MENU button and then press the ENTER button ».

The quick menu gives you the following options:

- Toggle the display orientation between auto, normal and inverted.
- Reboot the fixture.
- Load any of the three custom setting presets that have been saved previously or load the factory default settings.
- Reinitialize the fixture by returning all settings to factory defaults, deleting all custom presets, returning all resettable counters to zero, setting the fixture's DMX address to 1 and setting the DMX Mode to the factory default (Mode 2: W Strobe + RGB Strobe).

Quick access options

When the fixture is connected to mains power and has booted normally, the following functions can be accessed quickly by pressing key combinations.

- Holding UP and DOWN pressed together for less than one second toggles the display orientation.
- Pressing UP or DOWN three times calls up a readout of the main fixture information and the fixture's settings.

Battery Eco mode

When the fixture is not connected to mains power and is running on its internal battery, holding MENU and ENTER pressed in together for 10 seconds activates *Battery Eco Mode*. This disables battery power to protect the battery from being run flat if the fixture is accidentally switched on during transportation.

Put the fixture into *Battery Eco Mode* before transportation or long-term storage.

To take the fixture out of *Battery Eco Mode*, simply connect it to power.

5. Setting up the control protocol

The JDC Line 1000 can be controlled via USITT512 DMX over a standard DMX cable link using the fixture's 5-pin XLR connectors or via Art-Net or sACN over network cable using the fixture's Ethernet port. This section explains how to configure the fixture to use the control data protocol that it is connected to.

The fixture is set up for control via a standard DMX cable link by default.

DMX

To configure the fixture to receive DMX control data over a standard DMX cable link, open the menus in the fixture's control panel and make the following adjustments:

1. In the first menu (root menu), give a suitable DMX address to the fixture.
2. In the **Protocol Setup** → **Protocol Type** menu, set the control protocol to **DMX** (the default setting).

These settings will not be affected if you apply a **Load Settings** command in the fixture's control panel, but the DMX address will be returned to 1 (the factory default) if you apply a **Load Factory Backup** command in the fixture's control panel.

Art-Net

To configure the fixture to receive DMX control data via Art-Net, open the menus in the fixture's control panel and make the following adjustments:

3. In the first menu (root menu), give a suitable DMX address to the fixture.
4. In the **Protocol Setup** → **Protocol Type** menu, set the control protocol to **Art-Net**.
5. Give all fixtures their own unique IP addresses. To do this, you can either:
 - set fixtures to generate their own IP addresses by choosing the ranges 2.x.x.x or 10.x.x.x (Art-Net specification),
 - set fixtures to acquire IP addresses automatically by DHCP, or
 - assign IP addresses manually by entering individual IP addresses and Subnet mask.
6. Select an Art-Net port/universe from 00000 (Network 0 / Subnet 0 / Universe 0) to 32767 (Network 7 / Subnet 15 / Universe 255). Note that the first Art-Net universe is considered to be universe number 00000, not 00001.

These settings will not be affected if you apply a **Load Default Settings** command in the fixture's control panel, but they will be returned to factory defaults if you apply a **Load Factory Backup** command in the fixture's control panel.

Note that it is possible to transmit DMX data as broadcast or unicast packages via Art-Net. If a large number of universes (more than 30) is broadcast, data loss can occur. If you suspect that this is happening, configure your console to unicast Art-Net DMX packages to fixtures, or switch to sACN.

sACN

To configure the fixture to receive DMX control data via sACN, open the menus in the fixture's control panel and make the following settings:

1. In the first menu (root menu), give a suitable DMX address to the fixture.
2. In the **Protocol Setup** → **Protocol Type** menu, set the control protocol to **sACN**.
3. Give all fixtures their own unique IP addresses. To do this, you can either:
 - set fixtures to generate their own IP addresses by choosing the ranges 2.x.x.x or 10.x.x.x (Art-Net specification),
 - set fixtures to acquire IP addresses automatically by DHCP, or
 - assign IP addresses manually by entering individual IP addresses and Subnet mask.
4. Select an sACN universe from 00001 to 63999.

These settings will not be affected if you apply a **Load Default Settings** command in the fixture's control panel, but they will be returned to factory defaults if you apply a **Load Factory Backup** command in the fixture's control panel.

6. Control menu layout

Menus		Notes	
DMX Address			
1 - 512		Enter DMX address	
Control Mode			
M1 – RGBW Strobe (CH32)		Select DMX control mode

7. DMX control modes overview

The following DMX control modes are available in the JDC Line 1000.

DMX Mode 1: RGBW Strobe

32 DMX Channels

RGBW strobe is a global strobe that uses all the White and all the RGB segments on Section A and on Section B together. This global strobe runs independently on each Strobe section. Each strobe has flash, pulse and ramp-up/down effects as well as special intensity effects such as lightning. The strobes offer RGBW control plus separate color temperature control that defines each section's white point.

Background color sets a background color on the RGB segments for Section A and B independently. As standard, the main color output always has higher priority than the background color.

You can define how background color and main color are mixed on both Strobes using *Background color* on the *Control/Settings* channel.

Control / Settings lets you configure the fixture remotely via DMX. Settings that you configure on the *Control / Settings* channel apply to both Strobe A and Strobe B.

Mode 1 RGBW Strobe

Strobe A RGBW

1	Intensity coarse
2	Intensity fine
3	Duration
4	Flash rate (Shutter)
5	Intensity effects (Strobe mode)
6	Control / Settings
7	CTC

9	Green
10	Blue
11	White

Strobe A Background color

12	Intensity background
13	Red background
14	Green background
15	Blue background
16	White background

Strobe B RGBW

17	Intensity coarse
18	Intensity fine
19	Duration
20	Flash rate (Shutter)
21	Intensity effects (Strobe mode)
22	<i>No function</i>
23	CTC
24	Red
25	Green
26	Blue
27	White

Strobe B Background color

28	Intensity background
29	Red background
30	Green background
31	Blue background
32	White background

DMX Mode 2: W Strobe + RGB Strobe

68 DMX channels

White strobe with FX runs on the White segments only of Section A and Section B independently. An effects engine with 50 patterns can be operated independently on each Strobe.

RGB strobe with FX runs on the RGB segments only of Section A and Section B independently. Again, an RGB effects engine with 50 patterns can be operated independently on each Section.

Both Strobes let you control *crossfading* (duration of changes between the steps in each pattern) and *transition* (duration of changes from one pattern to the next).

Pattern chain length lets you set up a chain of fixtures for the pattern to run across – it defines the total number of fixtures in the chain. *Pattern chain position* lets you set which position in the chain the fixture will occupy: first, second or third etc. fixture in the chain. The JDC Line 1000 occupies two positions as if it was two JDC Line 500s.

Strobe phase lets you shift the timing of each RGB Strobe (A or B) by 1 – 359° relative to the corresponding White Strobe (A or B). A 180° shift will result in a flip-flop between white and RGB flashes.

Pattern phase lets you shift the timing of the RGB pattern by 1 – 359° relative to the White pattern.

Background color sets a background color on the RGB segments for Strobe A and for Strobe B. As standard, the main color output always has higher priority than the background color. You can define how background color and main color are mixed using

DMX Mode 3: W Strobe + RGB Pixel

168 DMX Channels

White strobe with FX runs on the White segments only of each Strobe. Each Strobe has its own effects engine with 50 patterns. *Crossfading* sets the duration of changes between the steps in each pattern. *Transition* sets the duration of changes from one pattern to the next.

Pattern chain length lets you set up a chain of fixtures for the pattern to run across in a chase by defining the total number of fixtures in the chain. *Pattern chain position* lets you set which position in the chain the fixture will occupy: first, second or third etc. fixture in the chain. The JDC Line 1000 occupies two positions as if it was two JDC Line 500s.

RGB segments overall control gives overall output control of each Strobe's individually controllable RGB segments (see below). It offers the standard strobe channels for intensity and strobe effects plus a CTC Channel which lets you adjust the color temperature of the white output.

Strobe phase lets you shift the timing of each RGB Strobe (A or B) by 1 – 359° relative to the corresponding White Strobe (A or B). A 180° shift will result in a flip-flop between white and RGB flashes.

Background color sets a background color on the RGB segments on the RGB segments for each Strobe. As standard, the main color output always has higher priority than the background color. You can define how background color and main color are mixed using *Background color* on DMX channel 6, the *Control/Settings* channel. The setting selected on the

White segments overall control gives overall output control of each Strobe's individually controllable White segments (see below). It offers the standard strobe channels for intensity and strobe effects.

RGB segments overall control gives an overall output control of each Strobe's individually controllable RGB segments (see below). It offers the standard strobe channels for intensity and strobe effects plus a CTC Channel which lets you adjust the color temperature of the white output.

Strobe phase lets you shift the timing of each RGB Strobe (A or B) by 1 – 359° relative to the corresponding White Strobe (A or B). A 180° shift will result in a flip-flop between white and RGB flashes.

Background color sets a background color on each Strobe's RGB segments. As standard, the main color output always has higher priority than the background color. You can define how background color and main color are mixed using *Background color* on DMX channel 6, the *Control/Settings* channel. The setting selected on the *Control / Settings* channel applies to both Strobe A and Strobe B.

White segments individual control adjusts the output of each Strobe's individual White segments. The overall output of these segments is determined by each Strobe's *White segments overall control* channels (see above).

RGB segments individual control (upper, lower) adjusts the color of each Strobe's individual RGB segments. The output of these segments is determined by each

Strobe's *RGB segments overall control* channels (see above).

The RGB segments on each Strobe are split into upper and lower halves with individual control of each half. This gives individual RGB control of 40 RGB pixels on Strobe A and 40 RGB pixels on Strobe B.

Control / Settings lets you configure the fixture remotely via DMX. Settings that you configure on the *Control / Settings* channel apply to both Strobe A and Strobe B.

DMX Mode 7: MultiPix Quadpix

76 DMX Channels

White segments overall control gives overall output control of each Strobe's individually controllable White segments (see below). It offers the standard strobe channels for intensity and strobe effects.

RGB segments overall control gives an overall output control of each Strobe's individually controllable RGB segments (see below). It offers the standard strobe channels for intensity and strobe effects plus a CTC Channel which lets you adjust the color temperature of the white output.

Strobe phase lets you shift the timing of each RGB Strobe (A or B) by 1 – 359° relative to the corresponding White Strobe (A or B). A 180° shift will result in a flip-flop between white and RGB flashes.

Background color sets a background color on each Strobe's RGB segments. As standard, the main color output always has higher priority than the background color. You can define how background color and main color are mixed using *Background color* on DMX channel 6, the *Control/Settings* channel. The setting selected on the *Control / Settings* channel applies to both Strobe A and Strobe B.

White quad segments divides each Strobe's 20 White segments into 5 quad segments, each containing 4 segments, and gives intensity control. The overall output of these quad segments is determined by each Strobe's *White segments overall control* channels (see above).

RGB quad segments divides each Strobe's 20 RGB segments into 5 quad segments, each containing 4 segments, and gives RGB control. The

overall output of these quad segments is determined by each Strobe's RGB segments overall control channels (see above).

Control / Settings lets you configure the fixture remotely via DMX. Settings that you configure on the *Control / Settings* channel apply to both Strobe A and Strobe B.

8. DMX control channel layout

In the following DMX channel layout tables:

- Default settings are indicated with **bold type**.
- Where commands are followed by (3s hold) you must send that value continuously for 3 seconds (or other duration if indicated in the table) to apply the command.
- Some commands on the Control / Settings channel require the DMX value zero to be sent first and then moved directly to the DMX value required by the command concerned.
- Adjustments made on the Control / Settings channel apply to both Strobe A and Strobe B.
